Urbanization and its effects on water scarcity in the Islamic Republic of Iran: A retrospective cohort study

0HKUGDG)DUURNKL

University of Social Welfare and Rehabilitation Sciences, Iran

Any reduction in the availability of freshwater resources caused by climate change will be particularly problematic for those who live in areas already suffering water scarcity. The world urban population is expected to increase by 72% by 2050, from 3.6 billion in 2011 to 6.3 billion in 2050. The main objective of this study was evaluating the urbanization rate and its effect
