Scientific writing is an art and skill that must be learned through repetitive practice in reading, writing and review. During school and academic life, there are different moments you learn writing skills. These skills are not only necessary to successfully write your research paper, thesis or book writing; they are also a prerequisite for effective communication with colleagues or the general public in your academic or professional life. This workshop aims to provide brief guidelines and guidelines for the content, structure and method of scientific reporting with examples of what to do and what to do. You are encouraged to actively participate in the discussion, volunteer opinion, ask questions and promote learning. Our active discussion will create an environment in which all can have the opportunity to learn more from a variety of viewpoints.

I will give an extended introduction to the subject, then we will talk about the content and the necessary method, structure and design, page numbering, paragraph, tables and figures, literature, references, and bibliography. Syntax, word use, temporal use, passive / active sound, spelling too are hot topics. I will share with you information about "plagiarism" and "scientific misconduct". These are very serious matters.

Are you excited? Let's meet and enjoy the workshop.
