Abstract: This study examines the relationship between the quality of life of elderly patients and the quality of care provided by palliative care teams. The study was conducted in a tertiary care hospital in Barcelona, Spain. The study included 100 elderly patients who were receiving palliative care. The quality of life was measured using the EuroQOL-5D questionnaire, and the quality of care was measured using the Palliative Care Quality of Care (PCQC) questionnaire. The results showed that there was a significant positive correlation between the quality of life and the quality of care. The study also identified several factors that were associated with a higher quality of life, including the presence of a palliative care team, the availability of resources, and the involvement of family members. The study has implications for the development of palliative care programs in tertiary care hospitals.

Biography

Sok An is a Professor of Geriatrics and Gerontology at the University of Barcelona, Spain. He has published numerous articles on the quality of life of elderly patients and the quality of care provided by palliative care teams. He is also the author of several books on geriatrics and gerontology. He has been a member of several international organizations, including the International Association of Gerontology and Geriatrics (IAGG) and the International Association of Palliative Care (IAPC).
