

Global Summit on

# Agriculture, Food Science and Technology

October 26-27, 2018 | Boston, USA

---

**P**erceptions of the impact of climate change on food security and nutrition are being shaped by a combination of factors, including the severity of the climate change impacts, the vulnerability of the population, and the availability of resources to cope with the impacts. The World Health Organization (WHO) estimates that climate change could cause an additional 250 million people to be undernourished by 2050. This is a significant increase from the current 800 million people who are undernourished. The impact of climate change on food security and nutrition is a complex issue that requires a multi-sectoral approach to address. This includes improving agricultural productivity, reducing food loss and waste, and ensuring that all people have access to safe and nutritious food. The WHO is working with other organizations to develop strategies to reduce the impact of climate change on food security and nutrition. These strategies include promoting sustainable agriculture, improving food systems, and strengthening health systems. The WHO is also working to raise awareness of the impact of climate change on food security and nutrition and to encourage governments and the public to take action to address this issue.
