2<sup>nd</sup> World Conference on

# Industrial Chemistry and Water Treatment

May 22-23, 2017 Las Vegas, USA

## & $U \setminus V W D O O L Q H D P R U S K R X V_2$ that applications applications

Decently, surface-disordered TigOeferred to as black TigOwhich can absorb both visible and near-infrared solar light Kthat has triggered an explosion of interest in many important applications. Here, we demonstrate a selective reduction of commercialized degussa P-25 Tiganoparticles using simple room-temperature solution processing, which maintains the unique three-phase interfaces composed of ordered white-anatase and disordered black-rutile with open structures for easy electrolyte access. e strong reducing agent in superbase, which consists of lithium ion ethylenediamine (Li-EDA), can disorder only the white-rutile phase of P-25. Single P-25 Tizooparticles with this engineered surface made immediate contact with the electrolyte. is contact is called white-black-electrolyte three-phase interfaces and can not only e ciently internally separate electrons/holes through type-II bandgap alignment but also induce a strong hydiogentu(tion surface reaction. e white-black-electrolyte three-phase interfaces exhibited outstandingrobduction rates of 13.89 mmol/h/g using 0.5 wt.% Pt (co-catalyst) and 3.46 mmol/h/g without using any co-catalyst. ese values are the highest recorded in the world to date. In addition, our newly developed crystalline/amorphous reduce(rTiO<sub>2</sub>) that has low energy bandgap can e ectively generate reactive oxygen species (ROS) under solar light and successfully remove a bloom of algae. Only reduc TiO materials can generate ROS under solar light, which was con rmed by electron spin resonance. Among the three di erent types of Li-EDA treated TiQanatase, rutile and both phased JiOhe both phased rTiQshowed the best performance to produce ROS. e generated ROS e ectively removed the common green and any domonasis is the rst report on algae degradation under solar light, proving the feasibility of commercially available products for disinfection. Finally, we like to introduce transition metal chalcogenide materials for the hydrogen evolution reaction and energy storage with graphene akes.

#### Biography

Hyoyoung Lee has received his PhD degree at Department of Chemistry, University of Mississippi (USA) in 1997. He did his Post-doctorate at North Carolina State University, USA, for 2 years. He has worked at Electronics and Telecommunications Research Institute from 2000 to 2009 as a Team Leader. He moved to Sungkyunkwan University and has served as a Full Professor at Department of Chemistry, lecturing Organic Chemistry. He has served as a Director of National Creative Research Initiatives (NCRI), Center of Smart Molecular Memory from 2006 to 2015. Currently, he has serving as an Chntlr fCltergate d aNanst-ruturieoPhyscs a(CINAPIBS0015. CHs Pcrrentlrecearch larea s Pon oganic Csmiscondutung Cmte rialsin cluding alowhond gapCTiO2
