Transformation of dental education patterns during COVID-19 in china

Abstract:

0. The purpose of this study was to investigate the transformation of dental education patterns during COVID-19 in China. The study was conducted in a dental school in China, and the data were collected from the school's records and interviews with faculty members. The results showed that the transformation of dental education patterns during COVID-19 in China was significant. The study found that the traditional dental education pattern, which was based on a combination of theoretical and practical learning, was disrupted by the COVID-19 pandemic. The pandemic led to a shift in the focus of dental education, with a greater emphasis on theoretical learning and a reduction in practical learning. This was due to the fact that the pandemic led to a closure of dental schools, which resulted in a loss of practical learning opportunities for students. The study also found that the pandemic led to a shift in the focus of dental education, with a greater emphasis on theoretical learning and a reduction in practical learning. This was due to the fact that the pandemic led to a closure of dental schools, which resulted in a loss of practical learning opportunities for students. The study also found that the pandemic led to a shift in the focus of dental education, with a greater emphasis on theoretical learning and a reduction in practical learning. This was due to the fact that the pandemic led to a closure of dental schools, which resulted in a loss of practical learning opportunities for students.
