

**R**esearch on the foot and ankle is a multidisciplinary field that involves the study of the anatomy, physiology, pathology, and treatment of the foot and ankle. The field is constantly evolving, and new research is being conducted in a variety of areas, including biomechanics, genetics, and regenerative medicine. This special issue of *Clinical Research on Foot & Ankle* features a collection of research articles that provide a comprehensive overview of the current state of the field and highlight some of the most important recent findings. The articles are organized into three sections: **R**esearch, **E**ditorial, and **C**linical. The **R**esearch section contains five articles, the **E**ditorial section contains two articles, and the **C**linical section contains three articles. The research articles cover a wide range of topics, including the pathophysiology of foot and ankle pain, the role of the foot and ankle in gait, and the effectiveness of various treatments for foot and ankle conditions. The editorial articles provide a critical analysis of the current state of the field and identify areas for future research. The clinical articles describe the latest advances in the diagnosis and treatment of foot and ankle conditions. This special issue is a valuable resource for researchers, clinicians, and patients alike. It provides a comprehensive overview of the current state of the field and highlights some of the most important recent findings.
