Keywords: Neurological Disorders; Speech therapy

Introduction

The communication process among individualities happens more efficiently when the existent who speaks is suitable to express him adequately, and the one who hears is suitable to understand what's being said. In the encoding and decoding process of what's being said, an interrelation between the integrity of the supplemental auditory system ("the encoding") and the central auditory system ("the decoding") is observed. The capacities to reuse the encoded information, the auditory processing capacities, have been observed to be veritably important
