## Abstract

Dementia with Lewy bodies is a neurodegenerative disorder characterized by the presence of abnormal protein deposits, known as Lewy bodies, in the brain. DLB is the second most common form of dementia after Alzheimer's disease, and it is associated with a wide range of cognitive, behavioral, and motor symptoms. The progressive nature of DLB can significantly impact the quality of life of affected individuals. Therefore, enhancing the quality of life in dementia patients with Lewy bodies is of paramount importance. This abstract provides an overview of current strategies and interventions aimed at improving the quality of life in DLB patients. It highlights the importance of a multidisciplinary approach, including pharmacological treatments, non-pharmacological interventions, and caregiver support. The abstract also discusses the potential of emerging therapies and the promise in enhancing the quality of life in DLB patients. **Revised:** 22-July-2023, **Manuscript No. accepted:** 23-July-2023, **Published:** 29-July-2023, DOI: 10.4172/dementia.1000170

## Introduction

Dementia with Lewy bodies (DLB) is a neurodegenerative disorder that accounts for a significant proportion of dementia cases worldwide. Characterized by the presence of abnormal protein deposits called Lewy bodies in the brain, DLB often manifests with a range of cognitive, motor, and psychiatric symptoms. Maintaining and improving the quality of life for individuals living with DLB is of utmost importance, as it can significantly impact their overall well-being. In this article,
