Challenges and limitations

receptor T-cell (CAR-T) therapies have become a major focus of cancer treatment, particularly for Non-Hodgkin Lymphoma. Among these, advanced Non-Hodgkin Lymphoma presents a major challenge due to its heterogeneous nature. CAR-T cell therapies, which involve engineering T-cells to express specific receptors that recognize cancer cells, have shown promise in overcoming this challenge. This study evaluates the efficacy of novel CAR-T cell therapies for Non-Hodgkin Lymphoma, examining current treatments and future directions.

Despite the promising clinical outcomes, CAR-T cell therapies for NHL are not without challenges. One of the primary concerns is the safety profile of these treatments.

Clinical efficacy in advanced NHL
