

## Insulin: The medication of Type 1 Diabetes

Mohamed Sayed\*

College of Pharmacy, King Saud University, Saudi Arabia

### Editorial

Insulin is a peptide hormone delivered by beta cells of the pancreatic islets; being the vitally anabolic chemical of the body is thought of. It directs the digestion of starches, fats and protein by advancing the ingestion of glucose from the blood into liver, fat and skeletal muscle cells. In these tissues the retained glucose is changed over into either glycogen through glycogenesis or fats (fatty oils) by means of lipogenesis, or, on account of the liver, into both. Glucose creation and discharge by the liver is rmly inhibited by high centralizations of insulin in the blood. Flowing insulin additionally in uences the
