

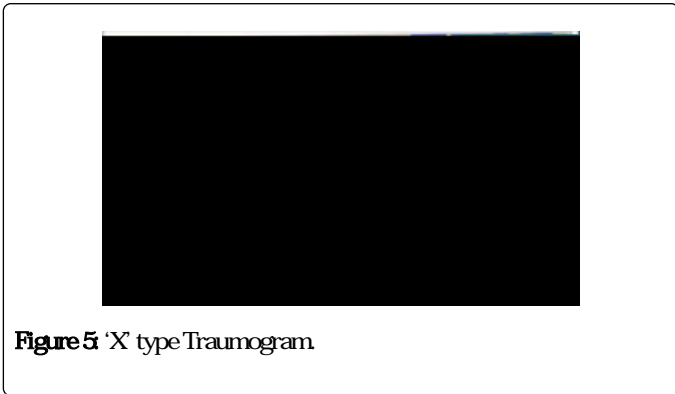

**Figure 4** 'V' type Traumogram

**Figure 5** 'X' type Traumogram

## Conclusion

In moderate injuries the traumogram is usually closed within 8-10 weeks. The enclosed squares are counted and they directly indicate the value of ocular traumogram which indicates the severity of injury. Various patterns of ocular traumogram were obtained with specific shapes and labeled as A, V, and X types of traumograms. Here degree of damage can be known as well rate and degree of progress with treatment. It may be possible to analyze other eye diseases on these principles.
