

Pharmacogenomics Drugs Effects on the Cardiovascular System

Oscar William* and Peter Baron

Department of Pharmacology, University of Minnesota, Minneapolis, Minnesota, USA

Abstract

Cardiovascular diseases remain a leading cause of morbidity and mortality worldwide, necessitating the continual refinement of therapeutic strategies. Pharmacogenomics, the study of how an individual's genetic makeup influences drug response, has emerged as a promising avenue for achieving personalized cardiovascular medicine. This review provides a comprehensive overview of the effect of pharmacogenomics drugs on the cardiovascular system. Additionally,
