

Abstract

The medicinal properties shown by different medicinal plants are due to the phytochemicals present in the plant. These phytochemicals are the most vital sources for the treatment of destructive diseases. Different phytochemicals have an extensive range of activities, which helps to enhance the immune system and give resistance against long term disease to protect the body from harmful pathogens. To examine and investigate the phytochemicals present in the selected medicinal plants commonly used in Gujrat was the main purpose of this study. The medicinal importance on the human body. Flavonoids, tannin, phenolic compounds and alkaloids are the most important bioactive components of plants. The names of plants are *Calotropis procera* (Ait.) R.Br. (Asclepiadaceae), *Lantana camara* (Linn.) Var. (Verbenaceae) and *Mangifera indica* Linn. (Anacardiaceae). Standard procedures were used to test the Methanolic extracts of powder of leaves were used for the qualitative measurement of various phytochemicals of discovering new plant-based drugs. The present study concluded that these medicinal plants have possessed different vital phytochemicals that helps in the medicinal properties of the studied plants commonly used in Gujrat.

1. Test for alkaloid: In 1% v/v HCL the plant extract is mixed, warmed and filtered. Now this filtered is used for following test.
 - a. Mayer's test: With Mayer's reagent (Mercuric chloride + Potassium iodide in water) the filtrate is treated. The presence of alkaloids specify by the formation of yellow colored precipitates.
2. Test for carbohydrates: In 5 ml distilled water, the plant extract is dissolved and filtered. By using this filtrate, the presence of carbohydrates can be tested
3. Molisch's test: Two drops of alcoholic - naphthol solution is treated with filtrate in a test tube. Carefully, using a dropper along with side of test tube, disposed tubes and pour drop wise conc. Sulphuric acid. At junction or interface of two liquids, the presence of carbohydrates indicates by the formation of violet color.
4. Test for glycosides: Glycosides are also of great importance and following test indicates its presence.
 - a. Froth test for saponins glycosides: By using distilled water the plant extract is diluted and this was shaken for 15 minutes in graduated cylinder. The presence of saponins was indicated by the formation of 1 cm layer of foam.
5. Test for phytosterols: Its presence indicates by the following test.
 - a. Salkowski's test: With chloroform and filtered the plant extract was mixed. 5-6 drops of conc. Sulphuric acid is treated with filtrate and shaken gently and allowed to stand carefully. The presence of triterpens (phytosterol) indicates by the appearance of golden yellow color.
6. Test for flavonoids: Following test indicates its presence.
 - a. Alkaline reagent test: The plant extract is treated with 2-3 drops of sodium hydroxide solution. Acute yellow color formation, that indicates presence of the flavonoids, by the addition of some drops of sulphuric acid that changed to colorless.
 - b. Test for phenols and tannin: Took 20 ml of distilled water in a test tube, the powdered sample of leaves is boiled and then filtered. The addition of 3-4 drops of 0.1% v/v Ferric chloride to the filtered sample changed the color to brownish green or blue, it indicates presences of phenols or the tannins.

Quantitative analysis of phytochemicals

1. Alkaloids: 5 g of plants sample are grabbed in a beaker and then solution of C_2H_5OH and 10% of CH_3CO_2H of 200 ml is included to plant sample. Encrusted the mixture and allowed it to stand for 4 hours then filtered. In a water bath until it reaches 1/4 of the native volume, extract was enabled to become concentrated then added conc. NH_4OH until the precipitation completed. Resolved the whole solution then collect precipitate and wiped with dilute NH_4OH and finally filtered. Then dried and weighed the alkaloid which is sublimate.
2. Flavonoids: 10 g of plant sample is frequently separated with 100 ml of 80% aqueous methanol at room temperature. Rough filter paper the whole solution is filtered then the filtrate is relocated into a water bath and solution is evaporated into dryness. Weighed the sample until a constant weigh.
3. Tannins: Quantity of tannins is deliberated by operating the spectrophotometer method. 0.5 g of plant sample is weighed into a 50 ml plastic bottle. 50 ml of distilled is included and agitated

Phytochemicals	Test procedure	Observation
Alkaloids	Filtrate + Mayer's reagent	Yellow coloured precipitate
Carbohydrates	Filtrate + Naphthol + Sulphuric acid	Violet colour
Glycosides	5 ml extract + 5 ml water shake	Foam produced
Phytosterols	2 ml extract + 2 ml $CHCl_3$ +2 ml H_2SO_4	Golden yellow colour
Flavonoids	2 ml extract + few drops of NaOH	Yellow color that clear on adding dil. HCL
Phenol and Tannins	Extract + 4 drops of $FeCl_3$	Blue-black coloration

Table 1: Phytochemical analysis procedures.

for 1 hr. The sample is filtered into a 50 ml volumetric flask and
