Introduction

Linear polyethylene (PE) is the most widely used thermoplastic polymer in the world. It is a semi-crystalline polymer with a melting point around 130°C. The mechanical and thermal properties of PE can be improved by the incorporation of inorganic fillers. Nanocomposites are a class of materials consisting of a polymer matrix reinforced with nanoscale fillers. The fillers can be inorganic particles, carbon nanotubes, or nanofibers. The incorporation of fillers can improve the mechanical, thermal, and electrical properties of the polymer matrix. The most commonly used fillers are carbon nanotubes and nanofibers. The mechanical properties of nanocomposites are improved due to the high aspect ratio of the fillers. The thermal stability of nanocomposites is also improved due to the presence of the fillers. The electrical properties of nanocomposites are also improved due to the presence of the fillers. The mechanical properties of nanocomposites are improved due to the high aspect ratio of the fillers. The thermal stability of nanocomposites is also improved due to the presence of the fillers. The electrical properties of nanocomposites are also improved due to the presence of the fillers.

In this study, we have synthesized MA-g-PE/LLDPE/LDPE/PLA nanocomposites. The MA-g-PE/LLDPE/LDPE/PLA nanocomposites were synthesized by the free radical polymerization of MA in the presence of LLDPE, LDPE, and PLA. The MA-g-PE/LLDPE/LDPE/PLA nanocomposites were characterized by FTIR, DSC, and TGA. The mechanical properties of MA-g-PE/LLDPE/LDPE/PLA nanocomposites were also studied. The MA-g-PE/LLDPE/LDPE/PLA nanocomposites showed improved mechanical, thermal, and electrical properties compared to the pure polymer matrix.

LLDPE/LDPE/PLA

MA-g-PE/LLDPE/LDPE/PLA nanocomposites. The MA-g-PE/LLDPE/LDPE/PLA nanocomposites were synthesized by the free radical polymerization of MA in the presence of LLDPE, LDPE, and PLA. The MA-g-PE/LLDPE/LDPE/PLA nanocomposites were characterized by FTIR, DSC, and TGA. The mechanical properties of MA-g-PE/LLDPE/LDPE/PLA nanocomposites were also studied. The MA-g-PE/LLDPE/LDPE/PLA nanocomposites showed improved mechanical, thermal, and electrical properties compared to the pure polymer matrix.
