Conclusion

The study shows that telemedicine is a viable option for gynecologic cancer care management during the COVID-19 pandemic. It provides a safe and effective way to deliver care to patients, while also reducing the risk of infection for both patients and healthcare providers. The study also found that telemedicine is a cost-effective way to deliver care, as it reduces the need for in-person visits and hospitalizations. These findings suggest that telemedicine should be considered as a key component of gynecologic cancer care management during the COVID-19 pandemic.

Acknowledgments

The authors thank the participants and staff for their contribution to this study.

Authors' Contributions

All authors contributed equally and significantly to the study.

Conflicts of Interest

The authors declare no conflict of interest.
