## **Abstract**

A novel hydro-kite like ocean power converter is proposed in this paper to harness each ocean contemporary and or submerged in the ocean and an electricity conversion unit set on a ship. The ocean wave or modern-day energies can be generated through pulling a pre-tensioned bendy tether that connects the hydro-kite-like kite and the electricity conversion unit. The standard dynamics of the novel ocean strength converter is essentially described and modelled based totally on the dynamics of key factors underneath each ocean wave and modern-day conditions. The feasibility
