## Abstract

Thoracic organ transplantation remains a viable treatment possibility in patients with Eisenmenger Syndrome (ES), though these patients are thought-about higher risk than alternative potential transplant recipients, in line with study results revealed in CHEST. Pectoral transplantation is commonly thought-about a good medical aid for patients with Es United Nations agency have refractory right chamber failure despite best medical aid for pneumonic blood vessel high blood pressure. Therefore, researchers compared the outcomes of bilateral respiratory organ transplant (BLT) with internal organ defect repair vs combined heart-lung transplant (HLT) to work out the foremost effective pectoral transplant strategy in patients with Es.
